
Save energy

How and where can energy be saved?

Saving energy means achieving the desired "performance" with less final energy (electricity, combustibles and fuels). But it also means simply doing without something. We can save energy everywhere: in the home, in industry and commerce and in transport. Sooner or later, this will pay off through the energy costs saved. The benefits are twofold: for the environment and for your wallet.

This checklist will show you how you can minimise your electricity and hot water consumption and save money. Correct heating and ventilation are essential to prevent mould from forming in your home. The checklist is available in [German](#) and [English](#).

Keywords: save energy, save energy, save less energy, save energy costs, save money
